General categories for ML
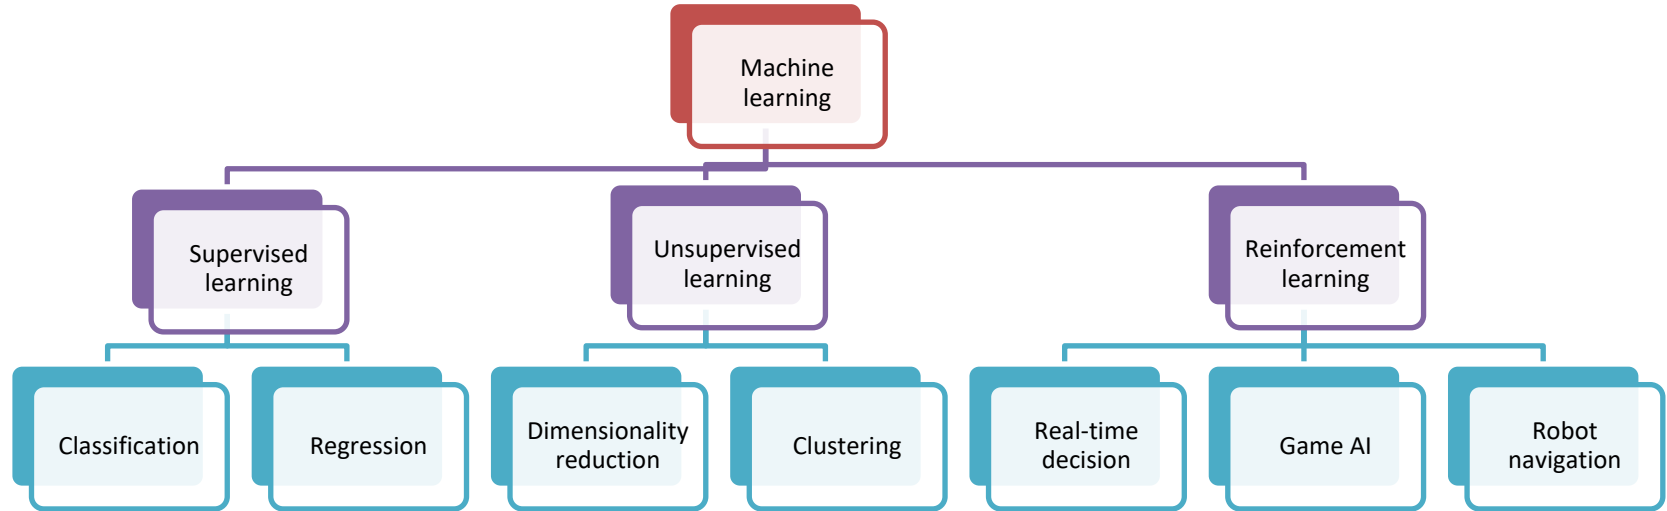

Self-Supervised Learning

The ImageNet Challenge Story …

1000 categories

- Training: 1000 images for each category

- Testing: 100k images
Andrew Zisserman, Relja Arandjelović

The ImageNet Challenge Story
… strong supervision

Classification Results (CLS)

Strong supervision:

- Features from networks trained on ImageNet can be used for other visual tasks, e.g. detection, segmentation, action recognition, fine grained visual classification

- To some extent, any visual task can be solved now by:
  1. Construct a large-scale dataset labelled for that task
  2. Specify a training loss and neural network architecture
  3. Train the network and deploy

- Are there alternatives to strong supervision for training? Self-Supervised learning ….

Why Self-Supervision?

1. Expense of producing a new dataset for each new task

2. Some areas are supervision-starved, e.g. medical data, where it is hard to obtain annotation

3. Untapped/availability of vast numbers of unlabelled images/videos

   - Facebook: one billion images uploaded per day

   - 300 hours of video are uploaded to YouTube every minute

4. How infants may learn …

Self-Supervised Learning

The Scientist in the Crib: What Early Learning Tells Us About the Mind
by Alison Gopnik, Andrew N. Meltzoff and Patricia K. Kuhl

The Development of Embodied Cognition: Six Lessons from Babies
by Linda Smith and Michael Gasser

What is Self-Supervision?

- A form of unsupervised learning where the data provides the **supervision**

- In general, withhold some part of the data, and task the network with predicting it

- The task defines a proxy loss, and the network is forced to learn what we really care about, e.g. a semantic representation, in order to solve it

Inferring structure
Context prediction

Can you guess the spatial configuration for the two pairs of patches?

Question 1:

Question 2:

Context prediction

Can you guess the spatial configuration for the two pairs of patches?   Much easier if you recognize the object!

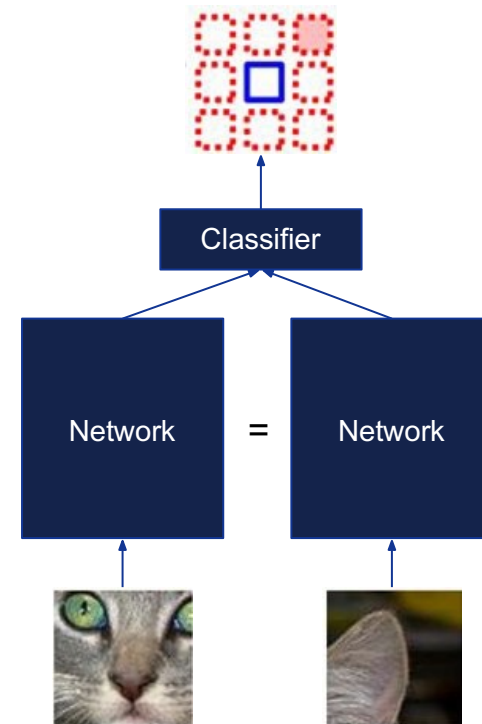

Intuition

- The network should learn to recognize object parts and their spatial relations

Context prediction

$$X = (\;\;\blacksquare\;\;,\;\;\blacksquare\;\;)\;;\; Y = 3$$

Context prediction

Pros

- (arguably) The first self-supervised method
- Intuitive task that should enable learning about object parts
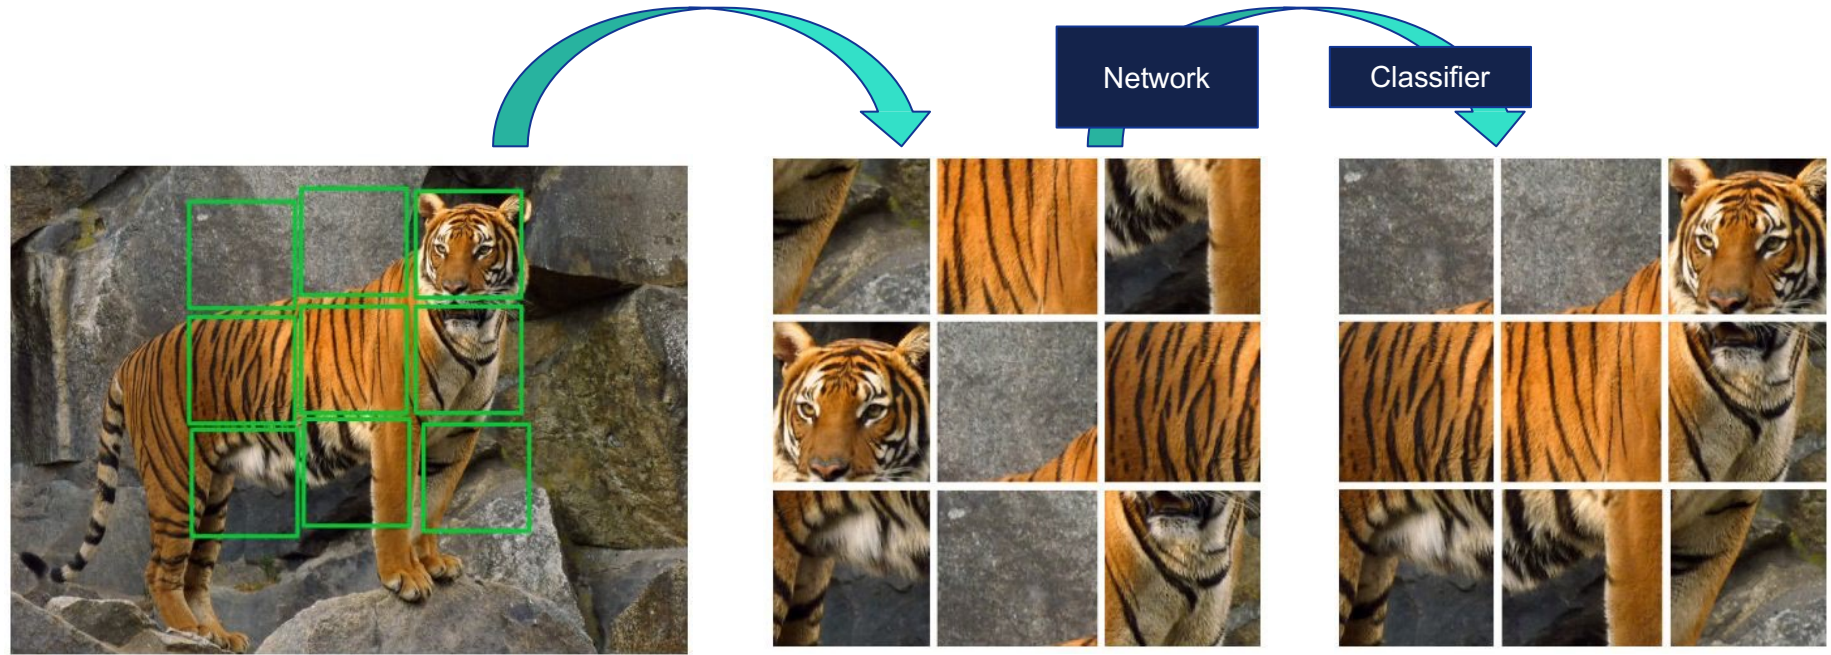

Cons

- Assumes training images are photographed with canonical orientations (and canonical orientations exist)
- Training on patches, but trying to learn image representations
- Networks can "cheat" so special care is needed [discussed later]
  - Further gap between train and eval
- Not fine-grained enough due to no negatives from other images
  - e.g. no reason to distinguish cat from dog eyes
- Small output space - 8 cases (positions) to distinguish?

Jigsaw puzzles

Divide image into patches and permute them

Predict the permutation

Network   Classifier

Pros & Cons: Same as for context prediction apart from being harder

15

Transformation prediction

90° rotation 270° rotation 180° rotation 0° rotation

Rotation prediction

Can you guess how much rotated is applied?

Rotation prediction

Can you guess how much rotated is applied? **Much easier if you recognize the content!**

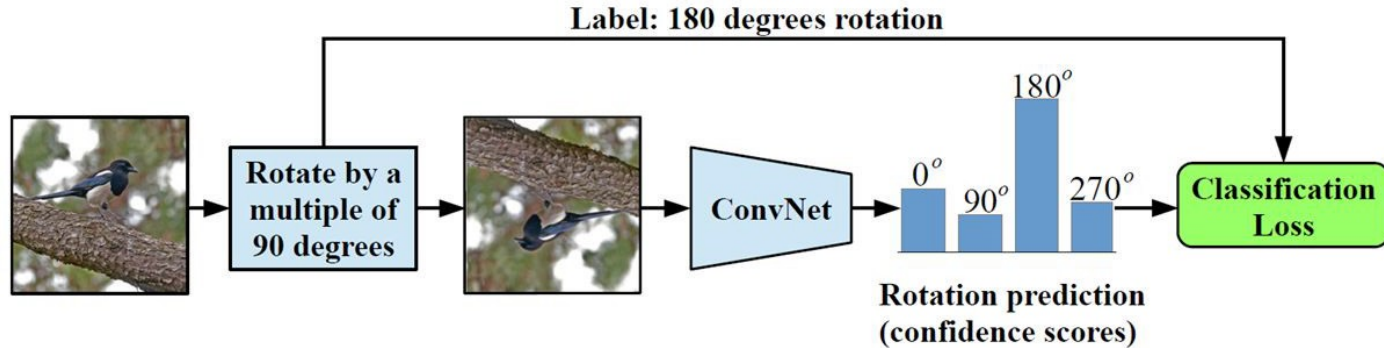

90° rotation   270° rotation   180° rotation   0° rotation

Rotation prediction

Label: 180 degrees rotation

Rotate by a multiple of 90 degrees → ConvNet → Rotation prediction (confidence scores) → Classification Loss
Pros

● Very simple to implement and use, while being quite effective

Cons

- Assumes training images are photographed with canonical orientations (and canonical orientations exist)
- Train-eval gap: no rotated images at eval
- Not fine-grained enough due to no negatives from other images
  - e.g. no reason to distinguish cat from dog
- Small output space - 4 cases (rotations) to distinguish [not trivial to increase; see later]
- Some domains are trivial e.g. StreetView ⇒ just recognize sky

Relative transformation prediction
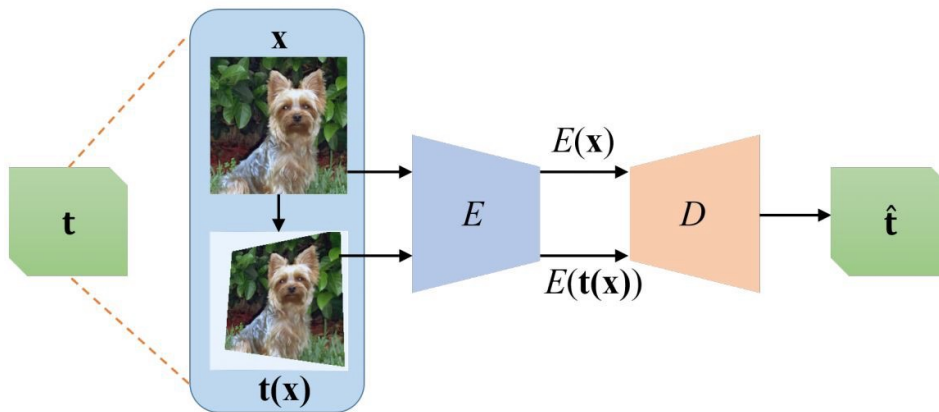

Estimate the transformation between two images.

Relative transformation prediction

Estimate the transformation between two images. Requires good features

$t(x)$

Relative transformation prediction

Pros

● In line with classical computer vision, e.g. SIFT was developed for matching

Cons

- Train-eval gap: no transformed images at eval
- Not fine-grained enough due to no negatives from other images
    - e.g. no reason to distinguish cat from dog
- Questionable importance of semantics vs low-level features (assuming we want semantics)
   - Features are potentially not invariant to transformations

Reconstruction
Denoising autoencoders

What is the noise and what is the signal?

Recognizing the digit helps!

Reconstruction loss

Decoder

Representation
Encoder

+ Noise

Input signal

Pros

- Simple classical method
- Apart from representations, we get a denoiser for free

Cons

- Train-eval gap: training on noisy data
- Too easy, no need for semantics - low level cues are sufficient

24

Context encoders

What goes in the middle?

Context encoders

What goes in the middle? Much easier if you recognize the objects!

Natural language processing (e.g. word2vec, BERT)

All [MASK] have tusks. ⇒ All elephants have tusks.

["Distributed representations of words and phrases and their compositionality", Mikolov et al. 13]
["BERT: Pre-training of deep bidirectional transformers for language understanding", Devlin et al. 18]

Context encoders

Reconstruction + perceptual loss

Decoder

Representation

Encoder

Mask out

Input image

Pros

- Requires preservation of fine-grained information

Cons

- Train-eval gap: no masking at eval
- Reconstruction is too hard and ambiguous
- Lots of effort spent on "useless" details: exact colour, good boundary, etc

Colorization

What is the colour of every pixel?

Colorization

What is the colour of every pixel? Hard if you don't recognize the object!

Context encoders

Reconstruction loss

Decoder

Representation

Encoder

Greyscale

Input image

Pros

● Requires preservation of fine-grained information

Cons

- Reconstruction is too hard and ambiguous
- Lots of effort spent on "useless" details: exact colour, good boundary, etc
- Forced to evaluate on greyscale images, losing information
30

Exploiting time

# Watching objects move

Which pixels will move?

Watching objects move

Which pixels will move? Easy if we can segment objects!

Watching objects move

Mask prediction
(pixel-wise logistic
regression)

Network

Pros

- Emerging behaviour: segmentation
- No train-eval gap

Cons

- "Blind spots": stationary objects
- Potential focus on large salient objects
- Depends on an external motion segmentation algorithm
- Cannot be extended to temporal nets (pretext task would be trivial)

34

Tracking by colorization

Given an earlier frame, colourize the new one.

Tracking by colorization

Given an earlier frame, colourize the new one. Easy if everything can be tracked!

36

Tracking by colorization

Reference Frame

Input Frame

Pointer

Reference Colors

Copy

Target Colors

Pros

● Emerging behaviour: tracking, matching, optical flow, segmentation

Cons

● Low level cues are effective - less emphasis on semantics
● Forced to evaluate on greyscale frames, losing information

Temporal ordering

Is this sequence of frames correctly ordered?

Temporal ordering

Is this sequence of frames correctly ordered? Easy if we recognize the action and human pose!

Temporal ordering

Pros

- No train-eval gap
- Learns to recognize human pose

Cons

- Mostly focuses on human pose - not always sufficient
- Questionable if it can be extended to temporal nets (potentially task becomes too easy)
Extensions

- N frames with one randomly placed - find it

  ["Self-supervised video representation learning with odd-one-out networks", Fernando et al. 16]

- Ranking loss: embeddings should be similar for frames close in time and dissimilar for far away frames
  ["Time-contrastive networks: Self-supervised learning from video", Sermanet et al. 17]
Multimodal

Audio-visual correspondence
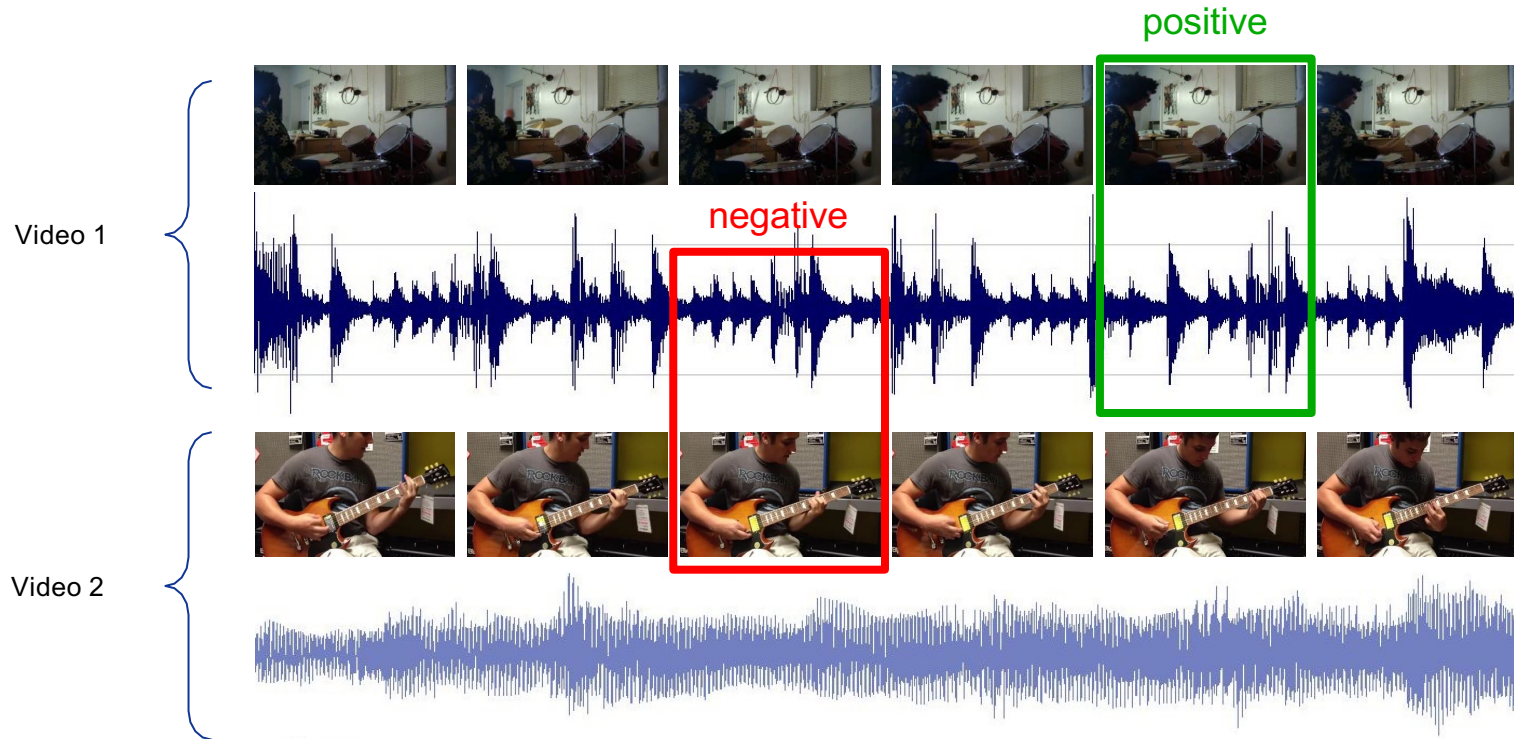

Does the sound go with the image?

Audio-visual correspondence

Does the sound go with the image? Easy if we recognize what is happening in both the frame and the audio

Audio-visual correspondence

Audio-visual correspondence

Binary classification loss

↑

Classifier

↗ ↖

Vision Network **Audio Network**

Pros

- Natural different views of the training data, no need for augmentations
- No train-eval gap
- Representations in both modalities for free

Cons

- "Blind spots": not everything makes a sound
- Exemplar based: videos of the same class or instance are negatives
- Small output space - two cases (corresponds or not)
    - Can be improved by contrastive approaches

Leveraging narration

Does the narration go with the video?

(Text obtained from automatic speech recognition)

Leveraging narration

Does the narration go with the video? Easy if we recognize what is happening in the video and narrations

(Text obtained from automatic speech recognition)

Complication compared to the audio-visual case:

- Narration and visual content are less aligned

Summary

- Self-Supervised Learning from images/video
  - Enables learning without explicit supervision
  - Learns visual representations – on par with ImageNet training

- Self-Supervised Learning from videos with sound
  - Intra- and cross-modal retrieval
  - Learn to localize sounds
  - Tasks not just a proxy, e.g. synchronization, attention, applicable directly

- Applicable to other domains with paired signals, e.g.
  - face and voice
  - Infrared/visible
  - RGB/D
  - Stereo streams …
